Dynamic options in Dashboard Studio

Use dynamic options in Splunk Dashboard Studio to conditionally style visualizations based on the data you connect to the visualization. For example, you can set dynamic options to modify a single value visualization's background color each time the connected data updates. Conversely, static options don't change based on data and stay the same. For example, a single value visualization with a fixed background color does not change even if the connected data changes.

You can use the Dashboard Studio visual editor to apply both dynamic and static options to visualizations. More advanced configurations for dynamic options involve writing the dynamic options syntax (DOS) in the Dashboard Studio source editor.

To learn more about dynamic options, see the following topics:

- Using dynamic options in the visual editor
- Modify and write dynamic options syntax
- Escapes, quotation marks, and deltas in dynamic options syntax
